PERSONAL SUMMARY

Backend Engineer with **nearly 3 years** of experience at **Jio Platforms**, building scalable distributed systems for enterprise Disaster Recovery. Experienced in designing event-driven architectures with **Java**, **Spring Boot**, **Kafka**, and **Go**, with a focus on high-throughput APIs, asynchronous processing, reliability, and distributed systems.

SKILLS

- **Languages:** Java (Proficient), Golang ,Python
- **Backend Frameworks:** Spring Boot, Spring Security, Hibernate
- **Data & Messaging:** Oracle, PostgreSQL, Redis, Apache Kafka, MongoDB
- **Cloud & Infra:** Azure, Docker, Kubernetes, Commvault
- **Engineering Competencies:** Distributed Systems, Microservices Architecture, Event-Driven Design, System Design, Scalability & Fault Tolerance
- **Computer Science Foundations:** Data Structures & Algorithms , Concurrency , Design Patterns
- **Performance Engineering:** Latency optimization, async execution pipelines, throughput tuning

WORK EXPERIENCE

Jio Platforms Limited - Software Development Engineer 1 *[Oct 2023 – Current]*

- **Built** an asynchronous validation framework for pre-validating inputs from multiple external APIs, achieving **12.8**× throughput via parallel rule execution, in-memory lookups, and JDBC batch updates - reducing downstream errors by **25%** and validation latency by ∼**90%** (validated via JMeter).
- **Architected** a pluggable async orchestration framework in **Java/Spring Boot** for MongoDB Cluster Sync, replacing centralized CMDB dependency with service-owned data , reducing sync failures by **60%** and eliminating a single point of failure across 8+ services.
- **Designed** Spring Boot APIs for customer **Disaster Recovery (DR) configuration and resource mapping**, enabling hierarchical discovery of projects, subscriptions, locations, and cloud providers. Architected a reusable query framework using **Builder**, **Specification**, and **Strategy** patterns to eliminate conditional query branching and simplify future feature expansion.
- **Built** Spring Boot APIs to publish **Disaster Recovery replication state** to Kafka and observability systems, implementing idempotent retries and dual-sink synchronization for reliable event propagation.
- **Engineered** internal tooling for centralized log retrieval across Kubernetes clusters and databases, reducing debugging time by ∼**30%** across 20+ microservices and adopted by ∼200 engineers.

PROJECTS

NTPC Naari Shakti Platform — Golang, Gin, GORM, PostgreSQL, Nginx, Docker *[Mar 2026 – May 2026]*

- **Built** a multi-role marketplace backend in **Golang** using **Gin** and a clean 3-layer architecture (Controller–Service–Repository), exposing **40+ REST APIs** for product listings, inventory, orders, and artisan onboarding.
- **Implemented JWT** authentication with **Redis**-backed token revocation and a 3-role **RBAC** system (Admin, Captain, Artisan), enforcing a two-level approval workflow through Gin middleware.
- **Developed** transactional order processing using **GORM** to ensure atomic inventory updates under concurrent requests, and containerized the application with **Docker** and **Nginx** for production deployment.

EDUCATION

Bachelors in Computer Science, Jawaharlal Nehru Technological University(JNTUK) 2019 - 2023
